

Jhonny Retail Agent One-Sprint Backlog

STATUS

One-sprint execution plan

AUDIENCE

Tiago, Rodrigo, founding team, and pilot reviewers

PREPARED

May 12, 2026

Table of Contents

1. Sprint Goal
2. Feedback-To-Backlog Mapping
3. Target Product Direction
4. One-Sprint Priorities
 - 4.1 Priority 0: Full-Page Frame And Left Sidebar
 - 4.2 Priority 1: Rebuild Overview
 - 4.3 Priority 2: Modernize Analytics
 - 4.4 Priority 3: Assistant UI Polish
 - 4.5 Priority 3A: Smarter Cursor-Like Agent
 - 4.6 Priority 4: Profile And Odoo Settings
 - 4.7 Priority 5: Productization And Auth Path
 - 4.8 Priority 6: Efficiency, Speed, And Best Practices
 - 4.9 Priority 7: High-Impact Client Quick Wins
 - 4.10 Priority 8: Data Protection And Client Trust
5. Effort Estimate Summary In Cursor Hours
6. Sprint Execution Checklist
7. Validation Plan

Executive Summary

The next version of the Jhonny Retail Agent should be delivered as one focused sprint. The goal is to turn the current POC into a sharper business-card product: a full-screen retail cockpit, a cleaner Analytics experience, a smarter assistant that understands Jhonny’s business, and a safer onboarding story for future clients.

This sprint should not be positioned as a multi-release roadmap. It is a single improvement sprint that groups the most important UI, agent, performance, onboarding, and data protection work into one delivery plan. The expected effort is approximately **228-492 hours of owner-led Cursor / vibe-coding execution time**, depending on how far the team goes on secure credential storage, authentication, and deeper agent memory.

1. Sprint Goal

Build a simpler, sharper, safer version of the app that can be shown to Jhonny and similar retailers as a credible paid-pilot product.

The sprint should deliver:

Outcome	What Good Looks Like
Full-screen product feel	The app occupies the full page and uses a left sidebar.
Strong Overview	The first screen shows business health, KPIs, a modern chart, and owner priorities.
Cleaner Analytics	Users can inspect Sales, Stock, Purchases, and Financials without heavy scrolling.
Smarter Assistant	The agent behaves like a business copilot, not just a tool router.
Repeatable onboarding	Profile and Odoo settings make future clients easier to enable.
Better performance	The app feels faster and avoids unnecessary frontend/backend work.
Client trust	The product has clear data protection controls and a security narrative.

2. Feedback-To-Backlog Mapping

Rodrigo’s feedback points to a clear product shift: the app should stop feeling like a POC landing page and start feeling like a full-screen retail operating cockpit.

Feedback Area	Sprint Response
App occupies only part of the page	Build a full-width shell with left-sidebar navigation.
Large Home hero does not make sense	Replace the surf/AI marketing hero with an Overview dashboard.
Need left bar tabs	Move navigation to Overview , Analytics , Assistant Agent , and Profile .
Analytics should avoid scrolling	Show one focused analytics section at a time with compact KPIs and one primary chart.

Feedback Area	Sprint Response
Charts should look more modern	Use cleaner line/area charts with minimal axes and date labels.
KPIs are too large	Reduce KPI card height, padding, and visual chrome.
Agent should not show tools/LLM	Hide technical metadata by default and show business-friendly evidence.
Need add chats	Add new chat and session switching.
Need profile/Odoo setup	Add Profile and Odoo setup, with tabs locked until connection is validated.
Avoid separate apps per user	Add tenant-aware settings, authentication direction, and secure credential handling.
Agent should act like Cursor	Improve the agent into a context-aware retail copilot with memory, reasoning, clarifying questions, and recommendations.
Need stronger data protection story	Add read-only access, secure credentials, tenant isolation, PII-safe logs, and a client-facing trust page.

3. Target Product Direction

Position the next version as an owner cockpit, not an AI demo. The first screen should answer: how is the business doing today, what changed, and what needs attention?

Recommended product model:

4. One-Sprint Priorities

All priorities below belong to the same sprint. The priority numbers describe delivery order and importance, not separate releases.

Priority	Area	Sprint Outcome	Estimated Effort
0	Full-page frame and left sidebar	Product feels like a modern SaaS cockpit.	8-16 hours
1	Overview rebuild	First screen becomes a business command center.	16-28 hours
2	Analytics modernization	Analytics becomes cleaner, smaller, and more useful.	24-40 hours
3	Assistant UI polish	Agent looks client-safe and easier to use.	12-24 hours
3A	Smarter Cursor-like agent	Agent reasons across Jhonny's business and supports follow-ups.	40-80 hours
4	Profile and Odoo settings	Future client onboarding becomes visible and repeatable.	24-48 hours
5	Productization and auth path	App has a practical path beyond one-client demo mode.	32-80 hours
6	Efficiency and best practices	App is faster and easier to maintain.	24-56 hours
7	High-impact client quick wins	Product delivers visible business value quickly.	24-48 hours
8	Data protection and client trust	App has a credible data-safe sales narrative.	24-72 hours

4.1 Priority 0: Full-Page Frame And Left Sidebar

Make the app occupy the full web page and feel like a modern SaaS cockpit.

Feature	Estimate	Notes
Full-width app shell	2-4 hours	Replace centered layout with app-sized workspace.
Left sidebar navigation	3-5 hours	Add Overview , Analytics , Assistant Agent , and Profile .
Active navigation state	1-2 hours	Make the selected section obvious.
Top bar cleanup	1-2 hours	Keep brand, connection state, theme, and user controls.
Footer reduction	1 hour	Avoid wasting cockpit space.
Initial CSS cleanup	2-4 hours	Remove obvious duplicate/legacy CSS conflicts.

4.2 Priority 1: Rebuild Overview

Replace the oversized Home hero with a business overview.

Feature	Estimate	Notes
Rename Home to Overview	1 hour	Aligns with cockpit language.

Feature	Estimate	Notes
Remove large marketing hero	2-4 hours	Drop the oversized "Where surfers become legends" box.
Compact KPI strip	4-6 hours	Use daily sales, profit, YTD sales, stock value, payables, margin, and low-stock count.
Modern primary chart	6-10 hours	Build a clean sales trend or business health chart.
Owner priorities card	3-6 hours	Use existing briefing/recommendation data.
Data freshness and Odoo status	2-4 hours	Build trust that data is live.
Remove fake trend labels	1-2 hours	No unsupported movement labels.
Last-good data or demo resilience state	3-6 hours	Avoid broken demos when Odoo is slow.

4.3 Priority 2: Modernize Analytics

Analytics should feel like one focused dashboard view per section, not a long BI report.

Feature	Estimate	Notes
Split analytics into Sales, Stock, Purchases, Financials	4-8 hours	One focused section at a time.
Day/week/month/quarter/year selector	4-8 hours	Map current values first, then improve backend periods later.
Compact KPI card treatment	3-5 hours	Reduce height and visual weight.
Modern chart treatment	8-16 hours	Cleaner line/area charts, less chart noise.
Insight/action side panel	4-8 hours	Translate chart into owner meaning.
Secondary breakdowns behind tabs/drawers	6-10 hours	Preserve depth without long scrolling.
Stock/purchases/financial risk panels	4-8 hours	Focus on owner decisions, not BI complexity.

4.4 Priority 3: Assistant UI Polish

Make the agent feel like a product assistant, not an engineering debug panel.

Feature	Estimate	Notes
Hide Tool , LLM , raw args, and request IDs by default	2-4 hours	Make answers client-safe.
Business-friendly evidence disclosure	4-8 hours	Use labels like "Data checked" and "Evidence used".
New chat button	2-4 hours	Basic session reset and new conversation flow.
Chat session switching	6-10 hours	Local session storage first.

Feature	Estimate	Notes
Better assistant empty state	2-4 hours	Outcome-focused starter prompts.
Portuguese-ready prompt examples	2-4 hours	Useful for local clients.
Contextual "Ask about this" buttons	4-8 hours	Link dashboard signals to agent questions.

4.5 Priority 3A: Smarter Cursor-Like Agent

The agent should feel closer to Cursor for Jhonny’s business: it should understand context, inspect the right data, explain its reasoning, ask follow-up questions, and suggest actions.

Capability	Estimate	Notes
Business context profile	8-16 hours	Store company type, categories, suppliers, seasonality, owner priorities.
Conversation memory	12-24 hours	Support follow-ups like “what about last month?”
Smarter multi-tool planning	12-24 hours	Combine sales, stock, purchases, payables, and margin.
Clarifying questions	6-12 hours	Ask when product/category/brand is missing.
Business diagnosis answers	8-16 hours	Produce “how is the business doing?” briefings.
Confidence and caveats	4-8 hours	Explain when margin/data quality is less reliable.
Generated action plans	6-10 hours	Convert findings into steps.
Portuguese questions and answers	6-12 hours	Detect/respond in selected language.
Agent evaluation tests	8-16 hours	Test follow-ups, Portuguese, ambiguity, and hallucination control.

4.6 Priority 4: Profile And Odoo Settings

This is the key step toward reusable pilots instead of one app per customer.

Feature	Estimate	Notes
Add Profile section to sidebar	2-4 hours	Gives settings a clear product home.
Company profile form	4-8 hours	Store name, vertical, language, currency, timezone.
Odoo credentials form	6-12 hours	URL, DB, username, API key.
Odoo connection validation endpoint	8-16 hours	Test credentials and show connection status.
Locked tabs until connection is validated	4-8 hours	Clear onboarding flow.
Client readiness checklist	2-4 hours	Shows what clients need to provide.
Last successful Odoo read status	2-4 hours	Builds confidence in live data.

4.7 Priority 5: Productization And Auth Path

Move from a single-client POC toward a repeatable paid-pilot product.

Feature	Estimate	Notes
Replace demo token direction with auth design	4-8 hours	Design and initial implementation path.
Basic signed sessions	12-24 hours	Needed before external clients.
Tenant/company configuration model	12-24 hours	Each client needs separate settings.
Parameterize hard-coded Jhonny identity	6-12 hours	Store name, vertical, currency, language.
Restrict direct <code>/tools/{tool_name}</code> access	4-8 hours	Avoid broad tool access in production.
Production webhook signature enforcement	4-8 hours	WhatsApp must be secure in hosted pilots.
Durable rate-limit direction	4-8 hours	Needed for multi-instance deployment.
Decide/deprecate legacy <code>src/web_app.py</code>	2-4 hours	Avoid route confusion.

4.8 Priority 6: Efficiency, Speed, And Best Practices

Make the app faster, easier to maintain, and safer to extend.

Feature	Estimate	Notes
Split large <code>frontend/app/page.tsx</code>	16-32 hours	Break into Overview, Analytics, Assistant, Profile, hooks, and charts.
Lazy-render analytics sections	6-12 hours	Avoid rendering every heavy chart.
Memoize derived chart/KPI data	4-8 hours	Reduce unnecessary recalculation.
Simplify Recharts usage	6-12 hours	Fewer chart types, shared wrapper.
Clean <code>frontend/app/globals.css</code>	4-8 hours	Remove duplicate layers and legacy rules.
Improve loading/error states	6-12 hours	Show stale data and clear refresh states.
Add request timeout handling	3-6 hours	Better behavior when backend/Odoo is slow.
Dashboard caching	8-16 hours	Short server-side cache for demo and speed.
Bounded Odoo reads and timing logs	8-16 hours	Improve backend reliability.
Build/lint/smoke validation	3-6 hours	Confirm stability before demo.

4.9 Priority 7: High-Impact Client Quick Wins

Add features that are easy to explain and valuable to retail clients.

Feature	Estimate	Notes
Daily owner briefing card	4-8 hours	Highest immediate client value.
Low-stock action list	4-8 hours	Prevent lost sales.
Overstock/dead-stock view	6-12 hours	Shows money trapped in inventory.
Supplier bills attention panel	4-8 hours	Highlights cash exposure.

Feature	Estimate	Notes
Purchase vs sales warning	4-8 hours	Warns when buying is ahead of sales.
Margin reliability score	6-10 hours	Shows whether margin can be trusted.
Data quality health check	8-16 hours	Missing costs, zero prices, below-cost products.
Export/share summary	4-8 hours	Copy daily/weekly summary to WhatsApp/email.
Language toggle for key labels	4-8 hours	Portuguese/English UI basics.
Weekly insights screen	8-16 hours	Recurring review artifact.

4.10 Priority 8: Data Protection And Client Trust

The product must be sellable not only as a smart retail cockpit, but as a safe way to use sensitive retail data.

Control	Estimate	Notes
Client trust page	2-4 hours	"How we protect your data" onboarding section.
Security checklist	2-4 hours	Pre-pilot secrets, CORS, auth, logging, Odoo permissions.
Read-only and least-privilege Odoo guidance	2-4 hours	Strong client-safe sales message.
Remove credentials from frontend flows	4-8 hours	Do not store API keys in browser local storage.
Encrypted server-side credential storage	16-40 hours	Required for serious hosted pilots.
Tenant data isolation	16-32 hours	Separate credentials, cache, settings, and access.
PII-safe logging	6-12 hours	Avoid secrets and personal data in logs.
Retention policy	4-8 hours	Define chat/log/cache retention.
Webhook hardening	4-8 hours	Require signatures and durable rate limits.
Role-based access direction	8-16 hours	Owner/admin/viewer foundation.

Client-facing trust narrative:

Message	Meaning
Read-only by default	The app helps owners decide; it does not change Odoo records in the first pilot.
Credentials stay server-side	API keys are not exposed in the browser.
Only needed data is used	The agent receives curated business summaries, not unrestricted database access.
Company data is isolated	Each tenant has separate credentials, cache, settings, and access controls.
Personal data is avoided	The assistant focuses on sales, stock, purchases, bills, and margin, not customer PII.
Every answer can show evidence	Users can inspect business-friendly evidence behind recommendations.

5. Effort Estimate Summary In Cursor Hours

The sprint is broad. The estimate below is not a traditional agency delivery estimate. It is intended as the hands-on time for **you working with Cursor / vibe-coding** to perform the tasks, including implementation, iteration, and basic local validation. It assumes no long external design approval cycle.

Area	Low Estimate	High Estimate	Notes
Priority 0: Full-page frame	8 hours	16 hours	Shell, sidebar, active state, first CSS cleanup.
Priority 1: Overview	16 hours	28 hours	KPI strip, chart, priorities, no fake trends.
Priority 2: Analytics	24 hours	40 hours	Cleaner sections, charts, period selector, risk panels.
Priority 3: Assistant UI	12 hours	24 hours	Metadata hiding, evidence, new chats, prompts.
Priority 3A: Smart agent	40 hours	80 hours	Memory, multi-tool reasoning, Portuguese, evaluations.
Priority 4: Profile/Odoo settings	24 hours	48 hours	Settings UI, validation, locked tabs.
Priority 5: Productization/auth path	32 hours	80 hours	Auth, tenant model, production route hardening.
Priority 6: Performance/best practices	24 hours	56 hours	Component split, caching, bounded reads, validation.
Priority 7: Client quick wins	24 hours	48 hours	Briefing, action lists, data quality, summary.
Priority 8: Data protection	24 hours	72 hours	Trust page, encrypted secrets, tenant isolation, PII-safe logs.
Total	228 hours	492 hours	Scope can be reduced by deferring deep auth/secrets/tenant work.

Recommended sprint cut if time is limited:

Keep In Sprint	Defer If Needed
Full-page shell and sidebar	Full role-based access
Overview redesign	Deep industry template system
Cleaner Sales analytics	Full analytics redesign for every secondary chart
Assistant metadata hiding and evidence	Persistent backend chat history
Daily briefing and action list	Advanced weekly insight automation
Basic Profile/Odoo setup screen	Fully encrypted multi-tenant secret vault
Data trust page and security checklist	Complete production compliance pack

6. Sprint Execution Checklist

Step	Work
1	Build the full-page app frame and left sidebar.
2	Rebuild Overview as the business command center.
3	Simplify Analytics into focused sections with modern charts.
4	Polish the Assistant UI and hide implementation details.
5	Add smarter agent behavior and evaluation coverage.
6	Add Profile/Odoo setup and connection validation.
7	Add high-impact client quick wins: briefing, action list, data quality, payables, stock risk.
8	Improve performance: component split, lazy rendering, caching, bounded Odoo reads.
9	Add data protection controls and trust narrative.
10	Validate build, smoke tests, agent quality, and PDF/demo materials.

7. Validation Plan

Validation Area	Check
Visual demo	App uses full page, left sidebar, and no oversized marketing hero.
Overview	User can understand business status in under 30 seconds.
Analytics	Primary views avoid awkward scrolling on a laptop viewport.
Chart quality	Overview and Sales charts feel modern and clean.
Dashboard contract	<code>/dashboard</code> still powers visible KPIs after the UI reshuffle.
Assistant evidence	<code>/chat</code> still returns evidence, while UI exposes only business-friendly evidence by default.
Agent intelligence	Test realistic Jhonny questions, Portuguese questions, ambiguous questions, follow-ups, and cross-domain diagnosis questions.
Hallucination control	Assistant does not invent trends, comparisons, margins, or stock risk when tool data is missing.
Performance	Profile dashboard load, analytics tab switch, and first assistant answer.
Security	Verify no Odoo credentials are stored in browser local storage, logs do not contain secrets, production webhooks require signatures, and tenant-scoped data cannot cross users.
Regression	Run frontend build and backend smoke checks before demo review.
